

From supplier document to customer quote, in one sheet.

Edit product details in Google Sheets. Choose what to quote. Use Squad to convert prices, add markup, review the items and publish the quotation.

You do not need to write formulas. Your everyday workspace is the **Products** tab.

1. What this feature is for

Use this when a supplier sends a price list, invoice or other product document, especially when it contains many items. Squad extracts the products so Growth can review them together in a familiar spreadsheet.

In Google Sheets

Edit names, notes, dimensions, quantities, supplier prices and sample details. Tick **Add to quote** for each item the customer should receive in the quotation.

In Squad

Import the edits, review and validate products, select the customer currency and markup, configure delivery or adjustments, update the sheet prices and create the quotation.

Three words to know

SR = sourcing request: the record containing the customer and products.

Sync = copy your sheet edits into Squad.

Validate = review an item in Squad and confirm its details are ready for quoting.

Before you start: sign into Squad and Google with accounts that can access the request and its linked workbook. For practice, use a test customer and a test SR in dev Squad. This is a guide to the simplified implementation; the checklist below is a test plan, not a claim that a live test has been completed.

2. Your first quote, step by step

[Upload →](#)[Open sheet →](#)[Edit & select →](#)[Sync →](#)[Validate →](#)[Update prices →](#)[Review & publish](#)

1

Create a request from a supplier document

Open the new-request page. In **Work in Google Sheets**, click **Upload vendor documents**. Select your file. Supported choices include PDF, PNG/JPG/WebP images, CSV, text and XLSX. You can upload up to 5 files: at most 10 MB each and 25 MB combined.

Wait for extraction. Open **Review extracted rows and anomalies** and check names, quantities, prices and currencies against the original document. Fill the required customer/request fields and click **Create SR**. Corrections to extracted rows are made after creation. This vendor-import path does not start automated sourcing or supplier outreach.

2

Open the linked Products sheet

Open the SR's product-options area and find **Work in Google Sheets**. Wait for **Workbook ready**, then click **Open Google Sheet**.

For an existing SR without a sheet, use **Review in Google Sheet**. For an older multi-tab sheet, first sync existing edits, then use **Switch to one product tab**. This creates a new simpler workbook and keeps the original; use the new link from Squad afterward.

3

Correct the products and choose what to quote

Work in **Products**. Enter supplier prices as numbers, select their currencies, and check quantities. Tick **Add to quote** only for the items you want included. Check the initial selections rather than assuming every row is selected.

Leave unused items in the sheet and untick them. Do not delete rows, paste new product rows, rename column headers, edit hidden IDs or replace formulas. Add or change the underlying products in Squad if needed, rather than inventing sheet rows.

4

Bring sheet edits back into Squad

Wait for Google Sheets to save. Return to Squad and click **Refresh sheet changes**. Open **Review changes** to inspect the differences. Then click **Sync sheet changes**.

Refresh is not sync. While the request page is open, Squad checks for changes roughly every 30 seconds. This shows what changed; you still need to sync to import it.

Look for **Imported ... cell changes. ... items need validation in Squad**. If Squad lists issues, fix them before continuing.

5

Review and validate the changed items

In Squad, review each selected item's pricing, product details and required packing/delivery information. Complete its validation. Imported product edits clear previous validation so a changed price is not silently approved.

The sheet intentionally has limited columns. Complete information such as carton weight, units per carton, delivery setup or other quote requirements in Squad when requested.

6

Set currency and pricing in Squad

In **Currency & quote pricing**, choose **Customer currency**, enter **Product markup (%)**, and fill Tax, Additional customer fees and Additional discount if needed. Use 0 when there is no adjustment.

Tick **Products only — exclude delivery charges** when delivery must not be included. Otherwise configure the shipping basis and delivery information in Squad; clearing this checkbox alone does not select a delivery service.

Click **Update prices in Google Sheet**. Squad calculates prices and writes them to the linked sheet. Wait for the success message. You do not enter a target customer total, and you do not type conversion formulas into the sheet.

7

Check the numbers before publishing

Reopen the sheet and check the customer-price columns and the summary below the product rows. Compare the selected items, currency, quantities, fees and total with Squad. You can calculate a preview before all validation is complete, but publishing still requires the necessary validation.

If you change a sheet input or quote setting afterward, repeat **refresh → sync → review/validate → update prices** as applicable. Even if a sheet formula changes immediately, that is not proof the draft in Squad is up to date.

8

Create the customer quotation in Squad

Open the quote builder and review the customer-facing preview. Check that only the intended items are present. Use the publishing controls when the quote is ready. Publishing creates a version of the quotation; it does not automatically send it to the customer. Download or send it through your normal approved process.

3. What every column means

B–L: your inputs. M–N: calculated outputs. A and O–T are hidden internal columns. Column letters may appear to skip because those columns are hidden.

Column	Heading	What you do	Purpose	Example
B	Product name	Edit	The name you want to use for this item. Keep it specific.	Canvas pouch
C	Notes / selling points	Edit	Short product facts or specifications. Put each point on a separate line in the same cell; up to six lines.	Cotton canvas; zip closure; one-colour logo (on separate lines)
D	Carton dimensions (cm)	Edit	Outside size of the packed shipping carton, not one product. Enter length × width × height.	40 × 30 × 20
E	Product dimensions (cm)	Edit	Size of one product. Use the same three-number format. These measurements help with product and packing review.	20 × 15 × 2

Column	Heading	What you do	Purpose	Example
F	Add to quote	Tick / untick	Tick to include this product in the quotation selection. Untick to leave it out. This is not an approval or a send button.	Checked = include; unchecked = exclude
G	Quantity	Edit	Number of units for the normal product quote. Use a positive whole number, not text such as "100 pcs". Sample quantities are set separately in Squad.	100
H	Supplier unit price	Edit	What the supplier charges for ONE unit, in column I's currency. Do not put the total order cost here.	10
I	Supplier currency	Edit	Currency of column H. Use a three-letter uppercase code. Changing this code does not convert H; H must already be a price in that currency.	USD, CNY or PHP
J	Sample fee	Edit if applicable	Supplier sample price used for a SAMPLE quote. Enter the amount in column K's currency. It is not automatically added to a normal product quote just because this cell is filled.	25
K	Sample currency	Edit if applicable	Currency of the sample fee in J. It can differ from the normal supplier currency.	USD
L	Sample details	Edit if applicable	Plain-language sample notes, such as timing or what the sample includes. Writing a fee or quantity here does not make it a numeric pricing input.	Sample lead time: 7 days; unbranded sample
M	Customer unit price (currency)	Calculated — do not edit	Price for one unit after conversion, markup and applicable costs configured in Squad. For sample quotes the heading becomes Sample unit price.	USD 12.00 in the practice example
N	Line total (currency)	Calculated — do not edit	For a selected normal product: customer unit price × quantity. An unchecked row contributes 0. Sample quote totals use the sample quantity from Squad.	100 × USD 12.00 = USD 1,200.00

The hidden columns: reference only

You do not need to unhide or manage these. Squad uses them to match products and calculate prices.

Column	Heading	Purpose
A	Row ID	Internal link between this row and the product in Squad. Do not change, copy or delete it.
O	Conversion rate	Rate used to turn one unit of supplier currency into customer currency.
P	Markup %	The product markup entered in Squad.
Q	Other cost / unit	System-calculated adjustment needed to match the quoted unit price, including applicable costs. It is not another input to fill in.
R	Decimal places	Rounding precision for the selected quote currency.
S	Source fees	Fees already associated with the quoted item in Squad. Selected rows' fees are added in the summary.
T	Quote currency	The customer currency selected in Squad.

Dimensions: use three positive centimetre measurements, for example **30 x 20 x 10** or **30 x 20 x 10**. A value such as "large" or "30 x 20" cannot be imported as dimensions.

4. Understand the price without a spreadsheet course

Supplier currency vs customer currency

The supplier might charge **CNY 100**. Keep 100 and CNY in the supplier columns. Choose USD or PHP in Squad if that is what the customer should see. Squad uses verified exchange rates to calculate the customer price.

When you change the customer currency, review all adjustment amounts too: tax 10 means 10 units of the currency currently selected, not a guaranteed equivalent of the previous currency's amount.

Markup vs final price

A **20% markup** adds 20% to the base product amount: 100 becomes 120 before delivery and other adjustments. It is not a 20% profit margin calculation.

The customer unit price can include other applicable costs configured in Squad. Use the actual calculated price when checking the line total.

Selected product total + source fees + tax + additional fees – discounts = customer total

For a normal quote, each selected product's line total is its rounded customer unit price multiplied by quantity. Unchecked rows contribute zero. The summary is below the product rows around columns M–N.

Summary label	Meaning
Quote currency / Product markup	Your current pricing choices from Squad.
Selected products / Selected samples	Sum of selected line totals. Any delivery already allocated to unit prices is included here.
Source fees	Applicable fees already attached to selected quote items; do not enter them again as additional customer fees.
Tax	An absolute amount added to the quote. Enter 10 for a tax amount of 10, not for a 10% tax rate.
Additional fees	An extra customer charge for the whole quote, entered in Squad.
Discount	A deduction. Enter the additional discount as a positive amount in Squad; the summary shows the subtraction. Existing applicable quote discounts can also affect the calculated total.
Customer total	The final calculated customer amount. Do not type a replacement total into the sheet.

Why a “products” breakdown can differ from DDP line totals: DDP line prices include delivery. Products excluding delivery of \$1,460 plus delivery of \$620 equals \$2,080 in DDP line totals. Add \$93.87 one-time fees and the final amount is \$2,173.87. Do not add the \$620 again to the \$2,080.

Practice example: an easy result to check

Use USD supplier and customer currencies, a normal product quote, products-only pricing, 20% markup, and no other costs or adjustments. The practice CSV is a supplier document for upload; do not paste it over the generated sheet.

Product	Add to quote	Quantity	Supplier unit price	Customer unit price	Included line total
Canvas pouch	Checked	100	USD 10.00	USD 12.00	USD 1,200.00
Cotton tote bag	Unchecked	50	USD 20.00	Not needed for this check	USD 0.00

Expected customer total: USD 1,200.00. If your test request already contains source fees, add-ons, discounts or logistics, remove those from the practice setup or account for them before comparing.

5. Step-by-step test checklist

Use a dedicated test SR. Complete the main workflow first, then run the checks below. Restore the baseline where instructed so one test does not change the next test's expected result. Tick a box only after comparing the actual result with the expected result.

0 of 14 checks complete — results last only for this open page.

☐ 1. Upload and create

Do: Upload the practice CSV on the new-request page, review extracted rows, fill the required request details, then click Create SR.

Expect: Two product rows are available and the workbook reaches Workbook ready.

☐ 2. One-tab layout

Do: Open Google Sheet from the new SR.

Expect: A Products tab contains the editable inputs and calculated price columns; internal columns are hidden.

☐ 3. Choose products

Do: Tick Canvas pouch and untick Cotton tote bag. Use Refresh sheet changes, then Sync sheet changes.

Expect: Only the pouch is selected in Squad. The tote remains available but is excluded.

☐ 4. Base calculation

Do: Use a normal product quote, USD customer currency, 20% markup, products-only delivery setting, and zero tax, additional fees and discount. Ensure there are no other fees/add-ons or discounts on this practice draft. Update prices.

Expect: Pouch customer unit price is USD 12.00; its line total and customer total are USD 1,200.00. The unchecked tote contributes 0.

☐ 5. Quantity edit

Do: Change pouch Quantity from 100 to 120 in Sheets. Refresh, review, sync, revalidate the changed item, and update prices.

Expect: The pouch line total is USD 1,440.00. Restore 100 and repeat the cycle before the next test.

☐ 6. Price edit

Do: Change pouch Supplier unit price from 10 to 11. Refresh, sync, review/validate, and update prices.

Expect: Unit price becomes USD 13.20 and the line total becomes USD 1,320.00. Restore 10 and repeat the cycle.

☐ 7. Selection edit

Do: Tick the tote too, sync and update prices.

Expect: The tote costs USD 24.00 per unit and USD 1,200.00 for 50 units. Both products total USD 2,400.00. Untick it, sync and update to return to the one-product example.

☐ 8. Adjustments

Do: For the one-product example, enter Tax 10, Additional customer fees 5, and Additional discount 15 in Squad. Update prices.

Expect: The summary shows +10, +5 and –15 USD. The customer total stays USD 1,200.00. These are amounts, not percentages.

☐ 9. Customer currency

Do: Set the three adjustments back to 0. Change Customer currency to PHP and update prices.

Expect: Supplier price stays 10 USD. Customer headings show PHP. Prices use the verified rate shown by Squad; compare the converted, rounded unit price × 100 with the line total. Do not expect a fixed exchange rate.

☐ **10. Freshness guard**

Do: Edit an input in Sheets and immediately attempt to update prices or publish without syncing.

Expect: Squad requires fresh imported inputs before finishing. Refresh and Sync sheet changes, then review/validate and Update prices again.

☐ **11. Invalid input**

Do: Enter 40 × 30 in Carton dimensions, then refresh and try to sync.

Expect: The invalid dimensions are rejected. Restore 40 × 30 × 20; sync, review and update prices.

☐ **12. Final quotation**

Do: Restore the USD baseline. Validate selected items, update prices, open the quote builder and inspect the preview. Publish only in your approved test environment.

Expect: Only the pouch appears as selected; currency, quantity, unit price, fees and final total match the latest sheet/Squad calculation. Publishing creates a quote version; it does not send it automatically.

☐ **13. Optional sample quote**

Do: Switch to a SAMPLE quote in Squad, set its sample quantity there, review sample terms, then update prices.

Expect: Column M/N headings become sample prices/totals. Pricing uses J/K and the sample quantity in Squad. Normal product Quantity G is not the sample quantity control.

☐ **14. Optional old-sheet migration**

Do: On a test SR with the old multi-tab workbook, sync pending edits before choosing Switch to one product tab.

Expect: Squad links a new one-tab workbook. The original workbook is retained. Continue using the newly linked workbook.

6. If something does not look right

What you see	What to do
I changed the sheet but Squad still shows the old value.	Wait for Sheets to save. Click Refresh sheet changes, inspect the difference, then Sync sheet changes. Refresh alone does not import.
A product is missing from the quotation.	Check Add to quote, sync the selection, validate the item and update prices. Also verify that you are looking at the latest quotation version.
The customer price is blank or old.	Check supplier price/currency, sync edits, and click Update prices in Google Sheet. Read any missing-rate or missing-input error. A price preview is not a completed publication.
"Inputs changed" or "Prices saved. Retry the sheet update".	Review and sync current inputs, then retry Update prices in Google Sheet. Do not publish until the sheet update succeeds.
An item needs validation again.	This is expected after product edits are imported. Review the changed fields in Squad and validate them again.
The same field changed in both Squad and Sheets.	Decide which value is correct. Reconcile the field so both agree, then refresh and sync again. Do not repeatedly overwrite it from two places.
Missing/duplicate product rows, unknown product, or rows moved during update.	Restore the original row identities/structure and refresh. Avoid sorting or editing while Squad writes prices. If a row moved during writeback, retry the update after editing has stopped.
I cannot edit customer prices or headers.	Those cells are protected intentionally. Edit supplier inputs in the sheet and currency/markup in Squad.
Google says I do not have access.	Use the correct Google account and ask the workbook owner/admin for access. Open the linked workbook from Squad rather than making an unrelated copy.
I see several tabs or the old "Include" heading.	You are using an older workbook. Sync it first, then use Switch to one product tab in Squad.
Tax, fees or discount are missing from the quote.	Make sure you entered numeric amounts in Currency & quote pricing, ran Update prices successfully, and are viewing the newly created quote version.

Does ticking Add to quote send anything to the customer?

Can I change PHP to USD by editing Supplier currency?

Do sample details or notes change the calculation?

Can I assume a sheet edit changes an already-published quote?

Guide basis: simplified Google Sheets feature introduced in PR #200; reviewed against dev source commit 3336511 on 17 September 2026. UI labels and column definitions were checked in the worksheet panel, pricing panel, sheet layout, import and calculation code. This document does not certify deployment status or test execution for a particular account.

Reference: Feature PR #200. This HTML works offline; links to Squad/GitHub need internet access. Share it together with the practice CSV, or use Print / save as PDF.
